

History of California Economizer

California Economizer was incorporated in 1988 to manufacture simple control systems for the HVAC industry.

Our engineering group and allied companies have actively been involved in this business for over 30 years. In 1967 we developed a novel VAV system using fluidic technology. We marketed this product through Mammoth and Chrysler. We then sold this company to McQuay in 1975.

In 1976 we developed an analog/electronic version of the fluidic control system. We introduced this product to the market in 1977. We sold it through Carrier Distributors for five years. Then subsequently, the product sold through Trane for seven years.

In 1988 our founders formed California Economizer to manufacture a new patented control system for the residential and light commercial markets.

California Economizer manufactures a complete line of zoning systems. This line includes nine unique zoning products from a two-zone residential system to a Direct Digital Control system that can handle up to 200 zones. California Economizer manufactures its entire product line at our plant in Huntington Beach, California.

Our companies developed package unit VAV. We and our associates were involved in the development of Carrier's VVT product. Tempmaster benefited from our technology in the development of York's EZ Zone system. We also provided the basic technology for Trane's development of the Vari-Trac system.

We continue to develop new products and upgrade our existing product line to meet the needs of an ever changing market. We committed California Economizer and our allied companies to enhance the performance of constant volume equipment. Our customers are Original Equipment Manufacturers, the Engineering Community, Architects, Contractors, Building Owners and Consumers who want a comfortable and controlled environment.

Innovation is our basic product
